

PC Specifications for Cygnus

Minimum PC specifications are detailed below however, we recommend PC's running an AMD Athlon processor which provides better performance than Intel processors.

Please note that Cygnus will not take advantage of dual core processors.

Operating System: Windows 95, 98, 2000, NT, XP

Other Software: Not required

CPU: Any AMD or Intel compatible processor greater than 500Mhz (we would recommend 3Ghz +)

Disk Space: Requires approximately 800Mb of free space to install Cygnus, including PAF. Disk space for processing requirements depends on volumes. If industry suppression files are being used then consideration is required for these. Anything from 5Gb to 150Gb would be required depending on which files are being used.

Cygnus is generally profligate with disk space so if high volumes are being processed then large capacity storage would be required (100Gb+ for example).

Memory: At least 512Mb, but recommend 1- 2GB
